PilotCopilot3. STARTING ENGINE.

- a. Check with navigator to see that battery disconnect, generator-ignition safety, and active inverter switches are "ON."

b. Set booster pump switch (figure 18-166) to "ON" (fuel pressure 6 to 7 lb/sq in. (.4 to .5 kg/sq cm).

c. Turn on engine primer switch (figure 18-168); prime 3 to 5 seconds if cold; 2 seconds if hot.

d. Set fire extinguisher switch (figure 16-144) to "ON."

- (1) If engine fails to start due to cold, instruct a crew member or a member of the ground crew to use hand crank. Then press engaging switch (figure 18-171) to "ON," followed by pressing energizing switch (figure 18-170) to "ON;" then hold both switches "ON."

e. Prime while engaging as required.

4. ENGINE WARM-UP.

a. As engine starts, check oil pressure gage (figure 16-125); if not 40 lb/sq in. (2.8 kg/sq cm) after 30 seconds, stop engine and investigate. Warm engine at 1200 rpm until oil temperature shows a definite increase and the oil pressure remains steady when throttle is opened.

b. Set booster pump switch (figure 18-166) "OFF" (fuel pressure 6 to 7 lb/sq in. (.4 to .5 kg/sq cm).

c. Open oil cooler shutter controls (figure 17-151) to oil temperature of 40^o degrees C (104 degrees F).

d. Check elevator trim tab control. (See figure 17-145.)

e. Check aileron trim tab control. (See figure 21-197.)

f. Check rudder trim tab control. (See figure 21-198.)

g. See that wing flap control handle (figure 17-148) is in "CLOSE" position.

h. Check each magneto at 1800-2000 rpm by momentarily turning each ignition switch off in turn; maximum manifold pressure 27 to 31.5 in. Hg (68.6 to 80 cm Hg)(maximum rpm drop 75). If drop is greater, run at same rpm for 15 seconds and recheck.

i. At 1600 rpm have navigator check voltmeter (figure 23-225) at 28 to 28.5 and the ammeter (figure 23-223) 40 to 60 maximum.

5. EMERGENCY TAKE-OFF.

- a. If the engines were properly diluted (figure 16-135) when previously stopped, no trouble should be experienced in maintaining oil pres-

PilotCopilot

sure of 80 to 90 lb/sq in. (5.6 to 6.3 kg/sq cm). Then proceed with normal take-off.

6. ENGINE AND ACCESSORIES GROUND TEST.

- b. Check flight controls for free and proper movement, and watch control surfaces for correct response.
- c. Check de-icer control (figure 16-98) "OFF."
- d. Check with crew to see hatches are closed and that lower turret is retracted.
- e. Check with navigator on fuel level gages.
- f. Check suction (figure 16-115): 3.75 to 4.25 in. Hg (9.53 to 10.8 cm Hg).

- a. See that automatic pilot or automatic flight control equipment (figure 16-114) is caged "OFF."

- g. Check hydraulic pressure (figure 16-122) at 800 to 1100 lb/sq in. (56.2 to 77.3 kg/sq cm).
- h. Check brake pressure (figure 16-123): 1000 to 1200 lb/sq in. (70.3 to 84.3 kg/sq cm).
- i. Fuel booster pumps (figure 18-163) "ON." Fuel pressure 6 to 7 lb/sq in. (.4 to .5/sq cm).
- j. Propeller controls (figure 18-165) at "INCREASE RPM" (locked snug).
- k. Mixture controls (figure 18-167) at "FULL RICH" (locked snug).
- l. Supercharger controls (figure 17-146) "LOW" (locked).
- m. Oil cooler shutters (figure 17-151) "OPEN."
- n. Carburetor air (figure 16-141) "NORMAL" or "ICING CONDITIONS" as required.
- o. Cowl flaps (figure 17-149) "OPEN" (control neutral).
- p. Emergency air brake (figure 21-199) safetied by wire in down position.
- q. Emergency hydraulic selector valve (figure 21-200) "NORMAL."

- r. Check with navigator to see that emergency fuel shut-off valves (figure 23-227) are "ON."
- s. Check with navigator to verify heater switch (figure 22-212) "OFF."

7. PREFLIGHT CHECK.

- a. Check flight controls for free and proper movement, and watch control surfaces for correct response.
- b. Check for position of elevator, aileron and rudder trim tabs.
- c. Wing flaps (figure 17-148) 20 degrees down (control neutral).

- t. Uncage gyro instruments. (See figure 16-114.)

PilotCopilot

(1) For best obstacle clearance on short run set flaps 30 degrees down.

8. TAKE-OFF.

- a. Do not turn on heater during take-off.
- b. Propeller controls (figure 18-165) increase rpm (locked snug).

- c. Engine rpm 2600 maximum and manifold pressure (figure 16-117) 44 in. Hg (111.8 cm Hg). Maximum time 1 minute (lock throttle snug).
- d. Landing gear retracted only on definite signal from pilot.
- e. Fuel pressure (figure 16-118) 6 to 7 lb/sq in. (.4 to .5 kg/sq cm).
- f. Cylinder temperature (figure 16-121) 160 degrees C minimum to 260 degrees C maximum (320 degrees F minimum to 500 degrees F maximum for 5 minutes).
- g. Oil pressure (figure 16-125) 80 to 90 lb/sq in. (5.6 to 6.3 kg/sq cm).
- h. Oil temperature 40 degrees C (104 degrees F) minimum 95 degrees C (203 degrees F) maximum.

i. Refer to "Take-off, Climb and Landing Chart."

9. ENGINE FAILURE DURING TAKE-OFF.

- a. Move mixture control (figure 18-169) to "IDLE CUT-OFF" and cut the ignition switch of dead engine.

b. If bomb bay droppable tank is installed, release immediately if sufficient altitude has been attained to open and close bomb doors. (See figure 16-102.)

c. Put nose of airplane down and make belly landing.

- d. Do not lower landing gear or nose wheel.
- e. If bombs are being carried do not release.

10. CLIMB.

- a. Landing gear (figure 21-192) "UP."
- b. Manifold pressure (figure 16-117) 38 in. Hg (96.5 cm Hg); maximum below 11,000 ft (3350 meters). 39 in. Hg (99.1 cm Hg); maximum above 11,000 ft (3350 meters).
- c. Engine rpm 2400 maximum.
- d. Fuel pressure (figure 16-118) 6 to 7 lb/sq in. (.4 to .5 kg/sq cm).
- e. Cylinder temperature (figure 16-121) 260 degrees C (500 degrees F) maximum for 15 minutes.
- f. Oil pressure (figure 16-125) 80 to 90 lb/sq in. (5.6 to 6.3 kg/sq cm).

Pilot

- i. Carburetor air (figure 16-141) "NORMAL" or "ICING CONDITIONS" as required.
- j. Supercharger: "LOW" below 11,000 ft (3350 meters); "HIGH" above 11,000 ft (3350 meters). Shift from low to high at 1400 to 2400 rpm.
- k. Wing flaps (figure 17-148) "UP"; cowl flaps (figure 17-149) "OPEN" (controls neutral).

11. FLIGHT OPERATION.

CAUTION: Do not allow one fuel tank to run completely dry before switching to another tank.

- (5) Mixture fuel (figure 18-167) "RICH."
- (6) Supercharger "LOW" below 13,000 ft (4000 meters); "HIGH" above 13,000 ft (4000 meters). Shift from "LOW" to "HIGH" at 1400 to 2400 rpm.
- (8) Carburetor air "NORMAL" or "ICING CONDITIONS" as required.

NOTE: Consult Automatic Pilot Check-Off list if airplane is so equipped.

12. ENGINE FAILURE DURING FLIGHT.

The minimum controllable speed with one engine at rated power is 140 mph, indicated. If the speed drops below 140 mph, the application of

Copilot

- g. Oil cooler shutters (figure 17-151) "OPEN." Oil temperatures 95 degrees C (203 degrees F) maximum. (See figure 16-119.)
- h. Mixture (figure 18-167) "FULL RICH."

a. Cruising.

- (1) Engine rpm maximum and manifold pressure 31.5 in. Hg (80 cm Hg) maximum.
- (2) Fuel pressure 6 to 7 lb/sq in. (.4 to .5 kg/sq cm). Fuel booster pumps "ON" as required to maintain 6 to 7 lb/sq in. (.4 to .5 kg/sq cm) fuel pressure.
- (3) Oil pressure 80 to 90 lb/sq in. (5.6 to 6.3 kg/sq cm).
- (4) Check suction 3.75 to 4.25 in. Hg (9.53 to 10.8 cm Hg).
- (7) Adjust oil cooler shutters to obtain 60 degrees C to 85 degrees C (140 degrees F to 185 degrees F).
- (9) Wing flaps and landing gear "UP" (flap control "NEUTRAL").
- (10) Cowl flaps closed or open as required (control neutral). Cylinder temperature 205 degrees C (401 degrees F) maximum.
- (11) Check volts 28 to 28.5; Amperes 40 to 60 maximum.

PilotCopilot

full power on the single engine causes the airplane to yaw. Airplane should be dived at reduced power to attain proper speed. Adjust rudder trim tab to counteract loss of engine thrust and fly the airplane with the dead engine high.

13. EMERGENCY CREW EXITS. (See section X.)14. APPROACH, LANDING, AND CROSS-WIND LANDING.a. Landing.

- (2) Set de-icer control (figure 16-98) "OFF."
- (4) Verify that lower gun turret is retracted.
- (5) Check fuel levels with navigator.

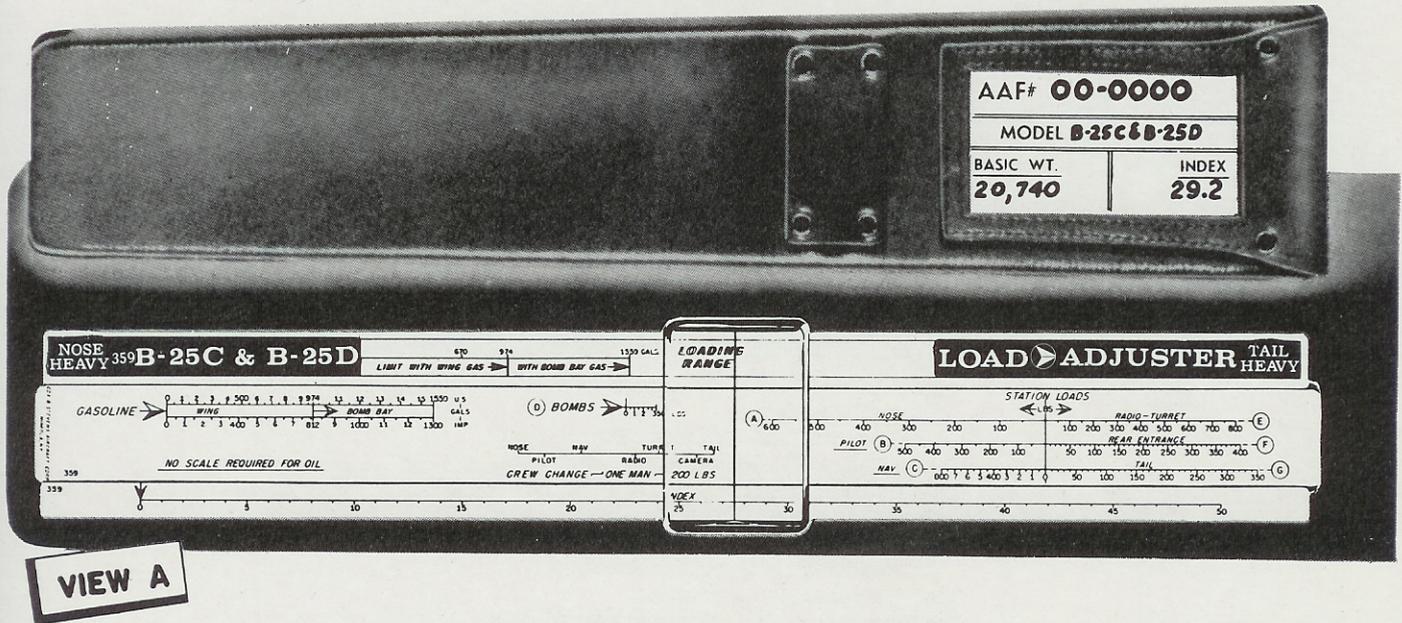

- (16) Check with navigator that heater control (figure 22-212) is "OFF."

CAUTION: If landing is not made, do not raise flaps until sufficient altitude and speed are obtained.

b. Emergency Operation of Landing Gear and Flaps.

- (1) Order navigator to lower nose gear.
- (2) At request of navigator, retard throttle momentarily to see that nose gear is locked

- (1) Turn automatic pilot (figure 16-114) "OFF."
- (3) Cage gyro instruments. (Figure 16-114.)
- (6) Check hydraulic pressure (figure 16-122) at 800 to 1000 lb/sq in. (52.6 to 77.3 kg/sq cm).
- (7) Check brake pressure (figure 16-123) at 1000 to 1200 lb/sq in. (70.3 to 84.3 kg/sq cm).
- (8) Check fuel booster pumps (figure 18-166) both "ON."
- (9) Set propeller (figure 18-165) at 2100 rpm.
- (10) Set mixture controls (figure 18-169) "FULL RICH."
- (11) Lock supercharger control (figure 17-147) at "LOW."
- (12) Oil cooler shutters (figure 17-151) "OPEN."
- (13) Cowl flaps (figure 17-149) "CLOSED" (control neutral).
- (14) Set landing gear (figure 21-192) "DOWN" and lock. Air speed should be less than 170 mph (148 knots) when lowering landing gear. Check operation by indicator (figure 16-111) and warning horn.
- (15) Safety emergency brake control (figure 21-199) with pressure at 400 to 425 lb/sq in. (28.1 to 29.9 kg/sq cm).
- (17) Set wing flaps (figure 17-148) "DOWN" (control neutral). Do not exceed 170 mph (148 knots).

17. Instructions for Use of Load Adjuster.

a. Airplane Loading. - Check and sign the weight and balance clearance prepared by the ground loading personnel. This may be rapidly and accurately accomplished by using a load adjuster (view A). The following instructions and sample loading problem are published as condensed instructions for the information and guidance of all personnel using a load adjuster to determine change in balance from the basic airplane to the loaded airplane as flown, and to insure that the weight distribution of all items loaded above and beyond the basic airplane weight and balance will not produce a weight and balance condition beyond permissible limits.

b. Application of Load Adjuster. - A load adjuster and carrying case for the models B-25C and B-25D airplanes will be found located on a mounting hook adjacent to the data case. Pick up the instrument and ascertain that the serial number for the airplane being loaded is identical with the serial number inscribed on the carrying case identification card (view A).

CAUTION: The airplane model designation stamped on every load adjuster indicates that the instrument may be used for balance calculations on any AAF airplane of that particular model. However, the index figure entered on the carrying case identification card is correct only for the specific airplane serial number printed directly above, and represents the balance moment of only that one individual basic airplane.

c. Operating Instructions.

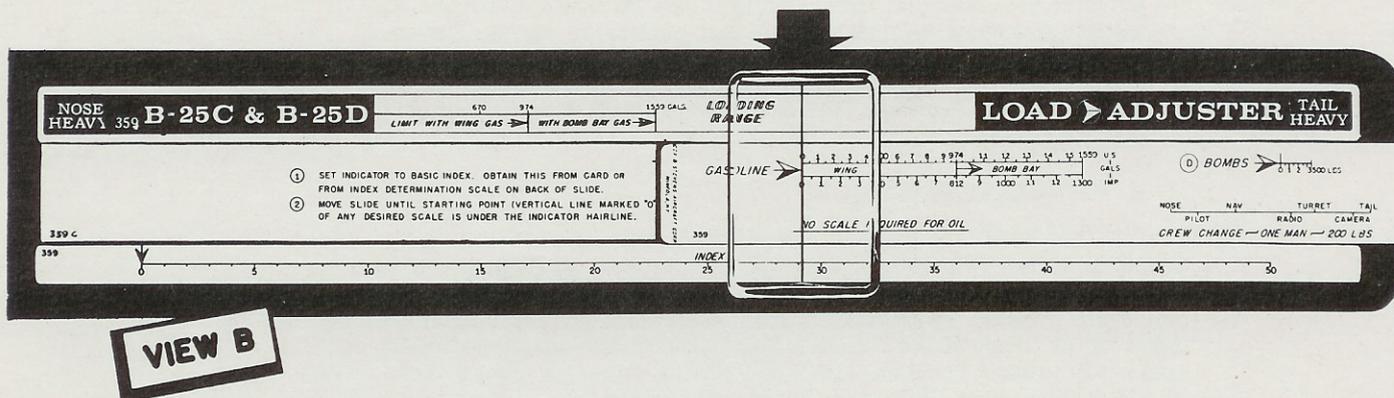

(1) The following sample loading problem is itemized in detail, and complete instructions with supporting illustrations are published to furnish the Service with complete instructions on loading aircraft above and beyond the basic airplane (including personal items and all items commonly referred to as "expendable" items) are to be taken into consideration for each and every loading problem, and their balance moments must be added with the load adjuster on the compartment scale where they are to be located.

(a) Given:

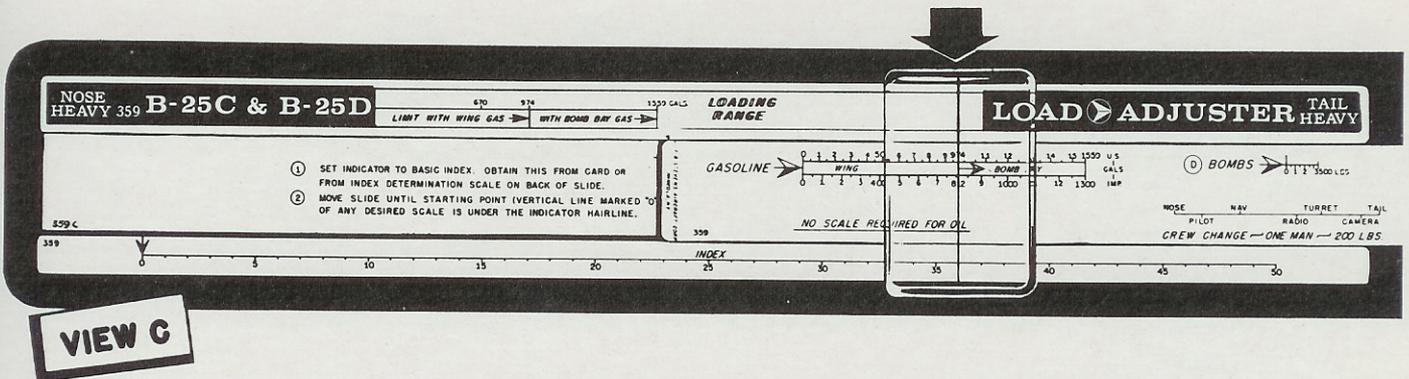

<u>Item</u>	<u>Sub-Total</u>	<u>Total</u>
Basic Airplane		20,740
Gasoline (974 U.S. gal - 812 Imp. gal)		6,744
Oil (42 U.S. gal - 35 Imp. gal)		315
Bombs (Bomb Bay)		3,500
Nose Compartment		525
Bombardier	200	
Special Equipment	300	
Handbook Data	25	
Pilots' Compartment		450
Brief Cases (2)	50	
Pilots (2)	400	
Navigator's Compartment		650
Navigator	200	
Crew Chief	200	
Special Equipment	200	
Navigational and Handbook Data	50	
Radio-Turret Compartment		800
Radio Operator	200	
Gunner	200	
Special Equipment	100	
Ammunition (1000 rd of .50 cal)	300	
Rear Entrance Compartment		400
Photographic Equipment and Supplies	125	
Photographer	200	
Brief Cases (3)	75	
Tail Compartment		125
GROSS WEIGHT		34,249

(b) To Find: If the load distribution brings the airplane balance within permissible cg limits as indicated on the load adjuster "loading range" scale.

(2) Set indicator hairline on basic airplane index 29.2 (obtain from identification card on the load adjuster carrying case), and move slide to the zero mark on the "GASOLINE" scale as shown in view B.

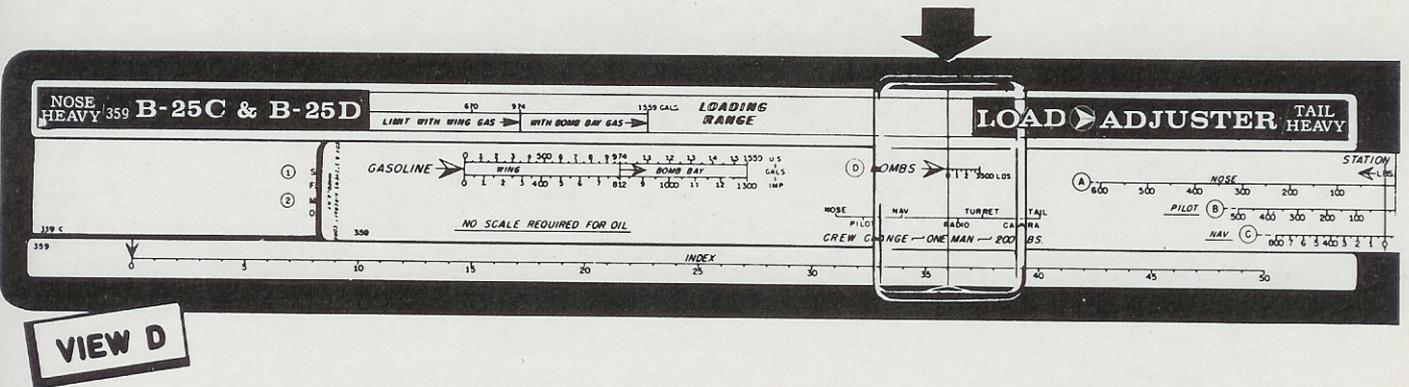

Move indicator until the hairline is over 974 on the top (U.S.) edge of the scale. This adds the balance moment of 974 gallons of gasoline as loaded in the airplane's wing tanks and moves the index to 36.0 as shown in view C.

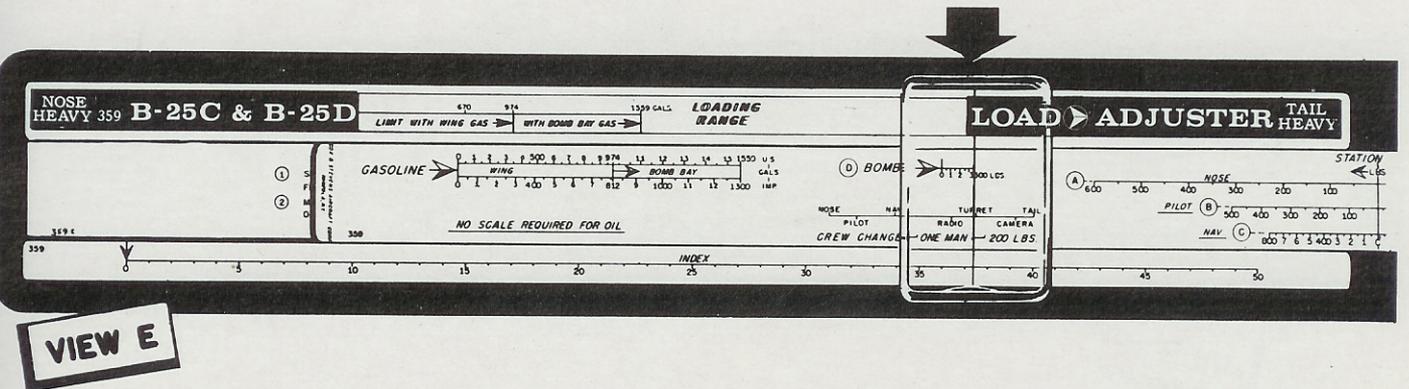

(3) No oil scale is necessary as the oil tank is located adjacent to the best cg.

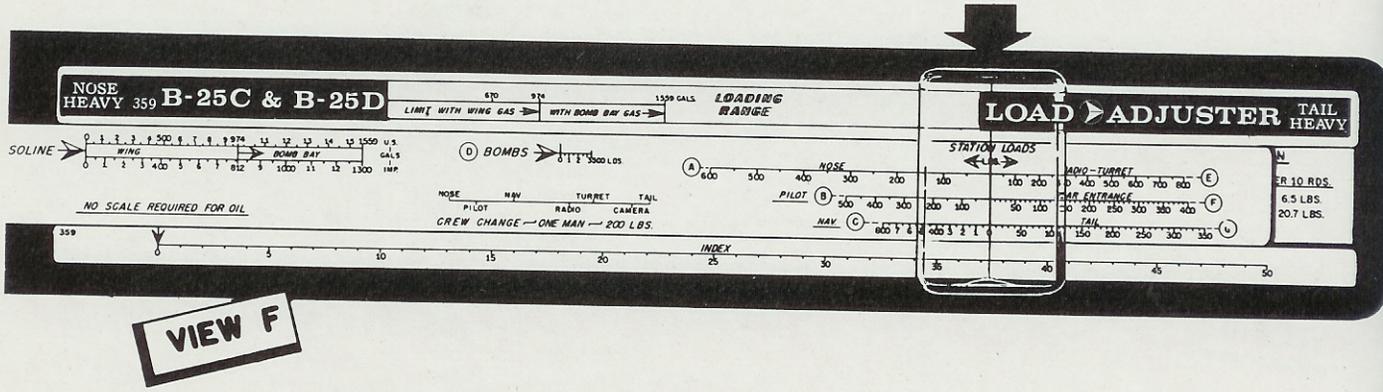

(4) Set slide to the zero mark on the "BOMBS" scale as illustrated in view D.

Move indicator until the hairline is over 3500 on the scale. This adds the balance moment of 3500 pounds of bombs as loaded in the bomb bay and moves the index to 37.4 as illustrated in view E.

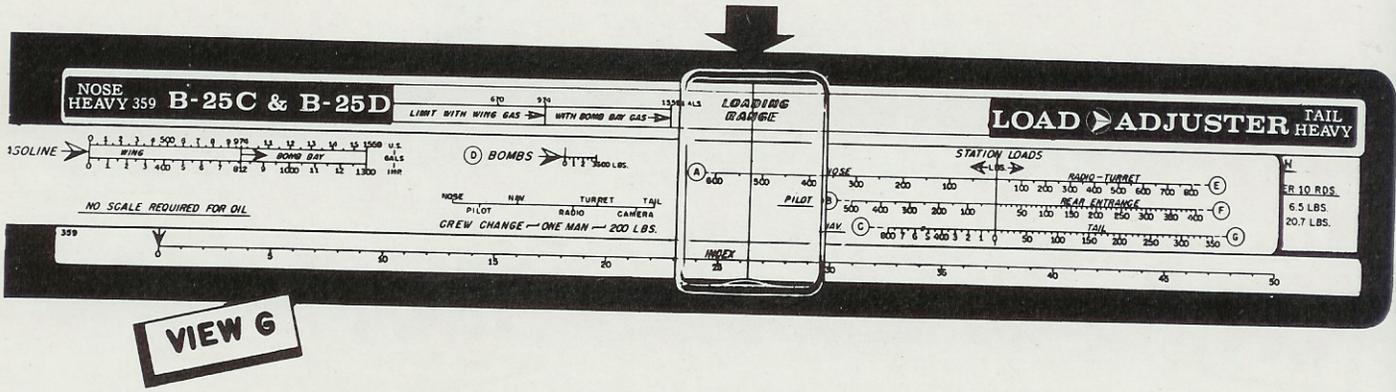

(5) Set slide to the compartment ("STATION LOADS") zero mark as illustrated in view F.

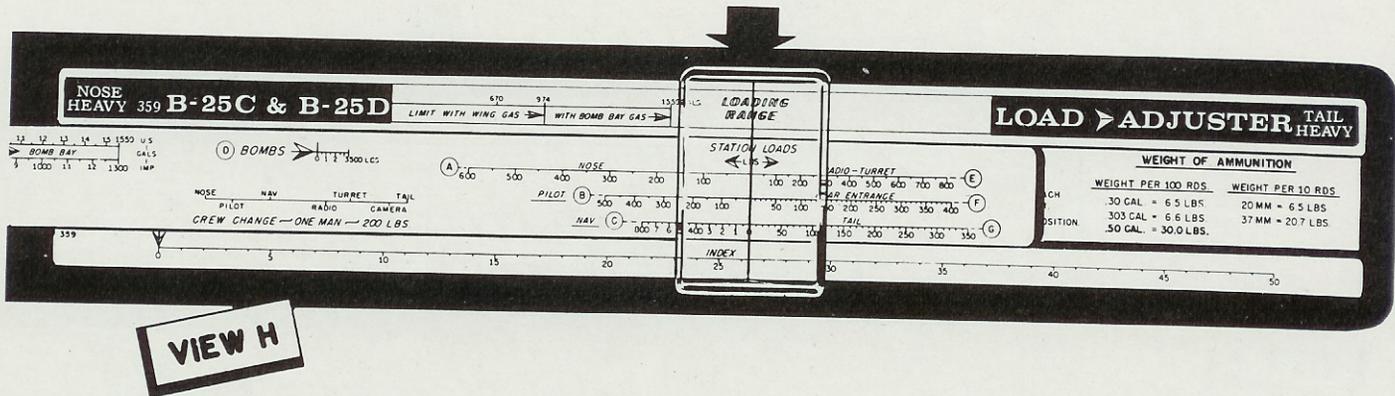

VIEW F

Move indicator until the hairline is over 525 on the "NOSE" scale. This adds the balance moment of the items that were loaded in that compartment and moves the index to 26.4 as illustrated in view G.

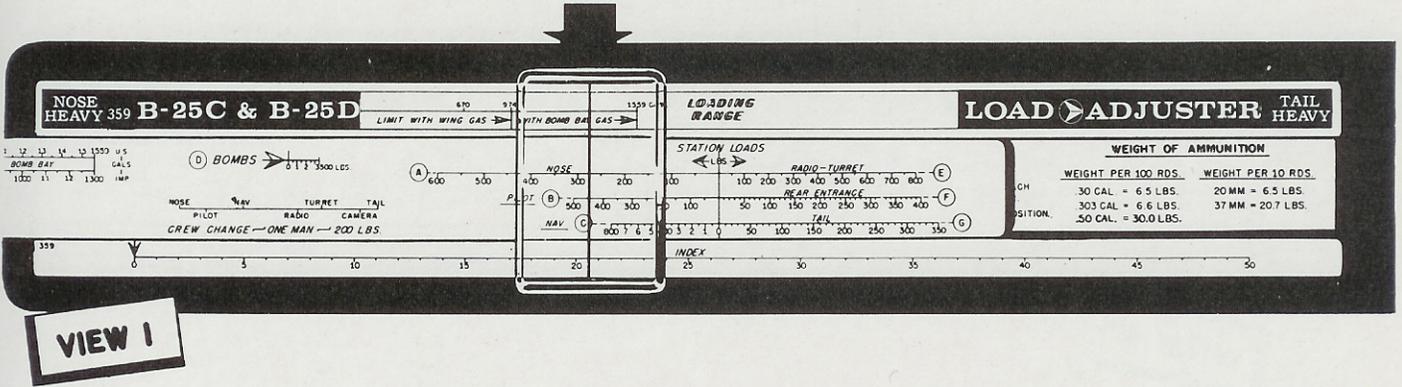

VIEW G

(6) Set slide to the compartment zero line as illustrated in view H.

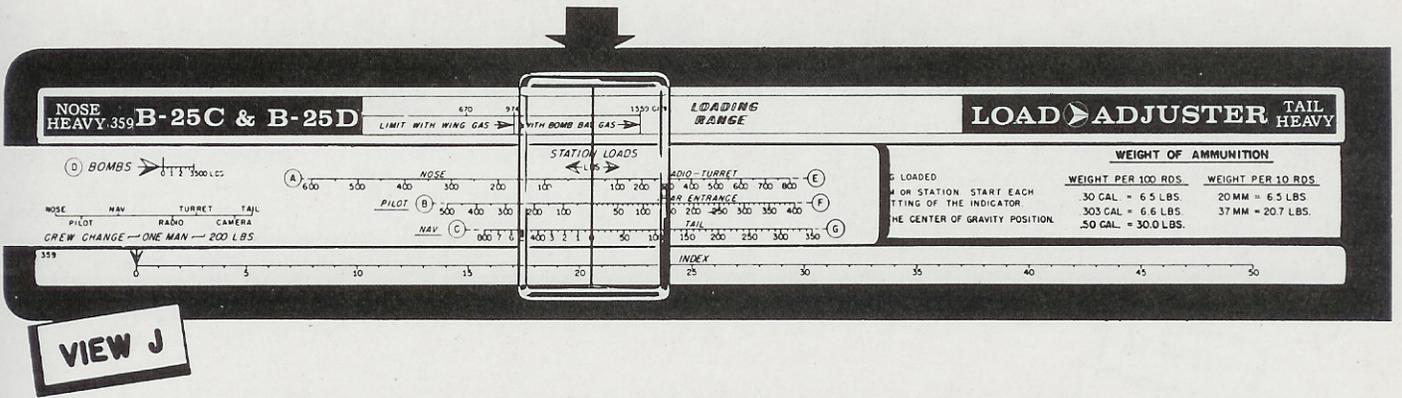

VIEW H

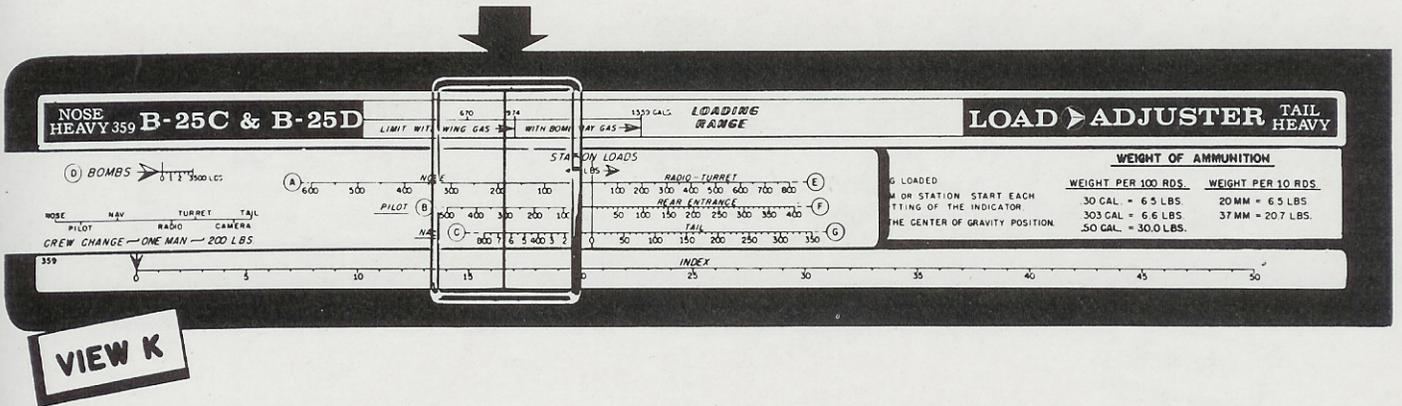

Move indicator until the hairline is over 450 on the "PILOT" scale. This adds the balance moment of the two pilots and their brief cases in the airplane and moves the index to 20.6 as illustrated in view I.

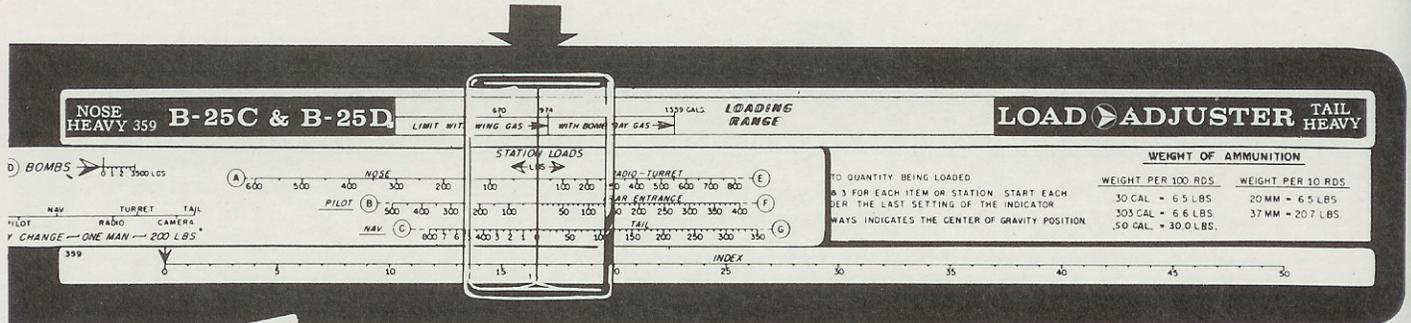

(7) Set slide to the compartment zero line as shown in view J.

Move indicator until the hairline is over 650 on the "NAV." scale. This adds the balance moment of two men, 200 pounds of special equipment and 50 pounds of navigational and Handbook data as loaded in the airplane and moves the index to 16.6 as shown in view K.

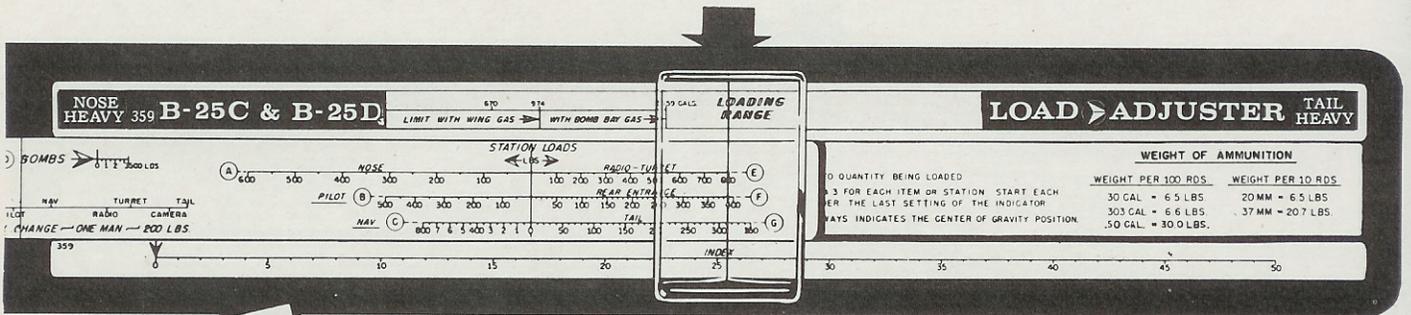

(8) Set slide to the compartment zero line as shown in view L.

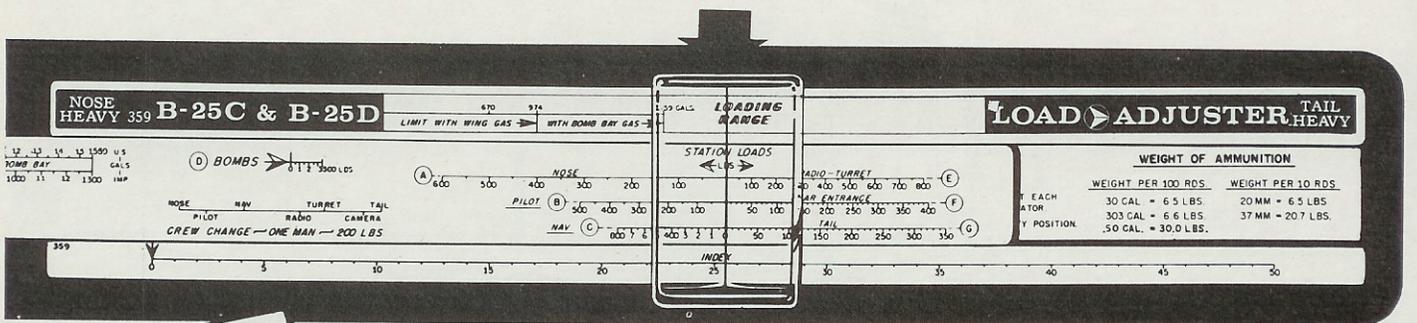

VIEW L

Move indicator until the hairline is over 800 on the "RADIO-TURRET" scale. This adds the balance moment of two men, special equipment and ammunition as loaded in this compartment and moves the index to 25.5 as shown in view M.

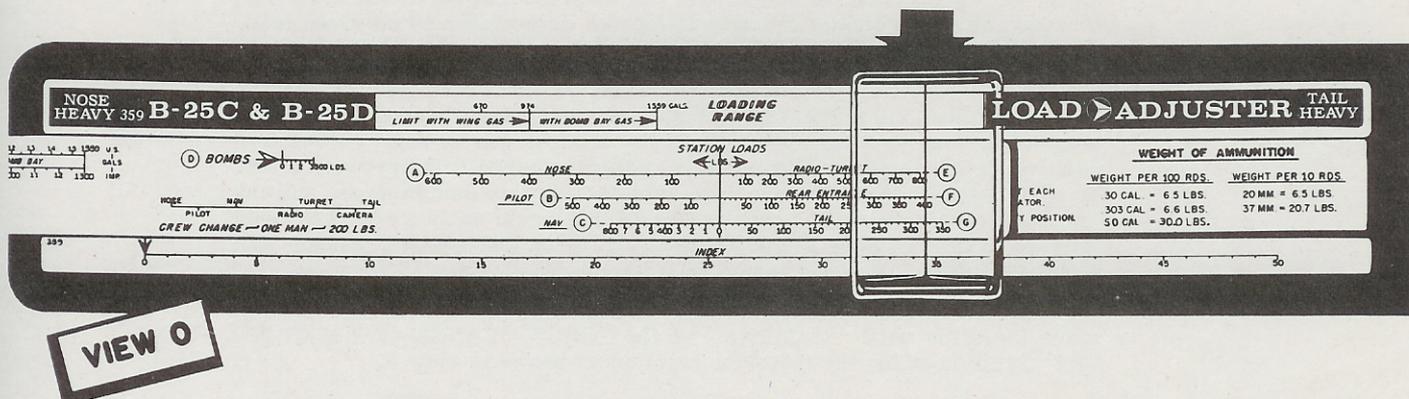

VIEW M

(9) Set slide to the compartment zero line as illustrated in view N.

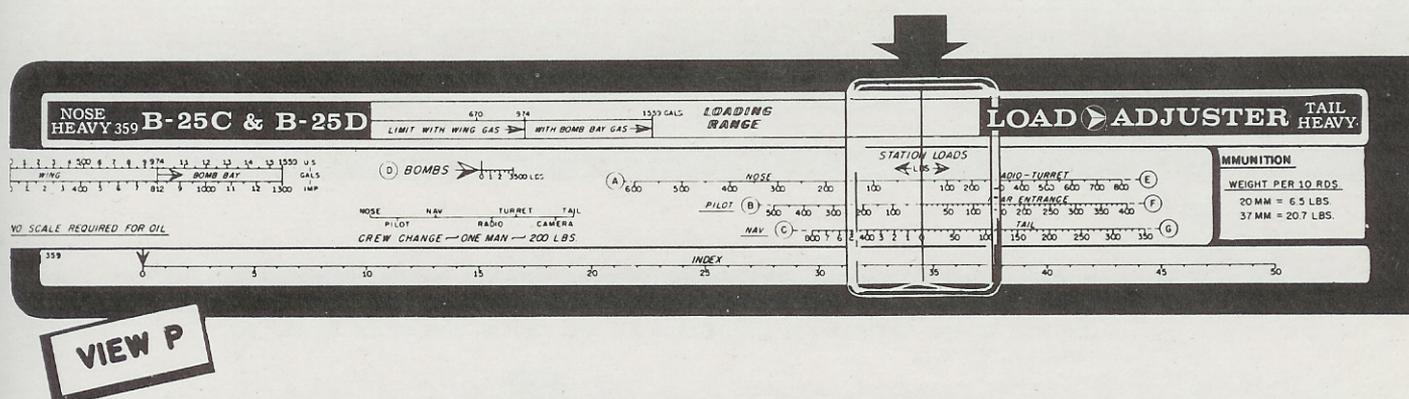

VIEW N

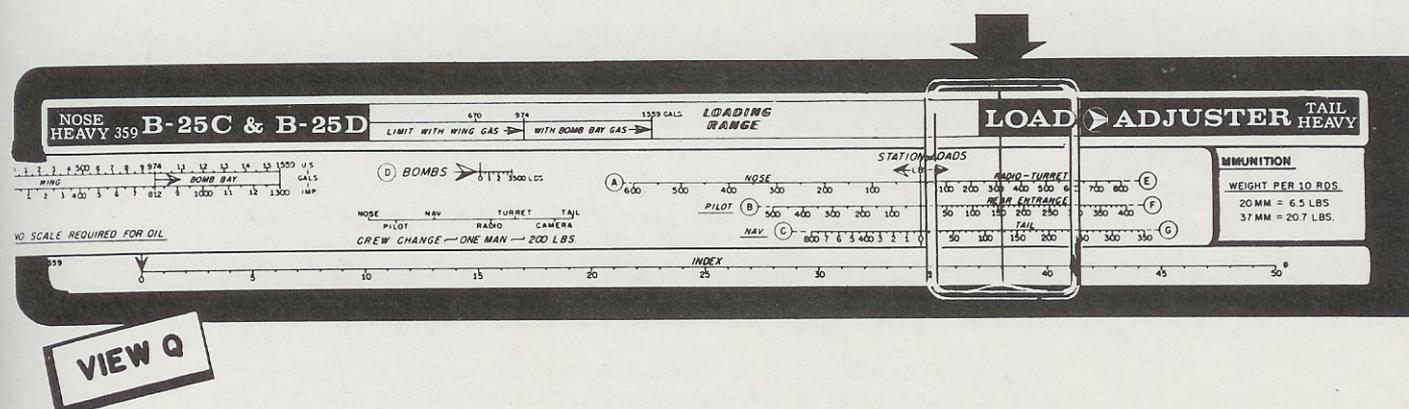

Move indicator until the hairline is over 400 on the "REAR ENTRANCE" scale. This adds the balance moment of photographic equipment and supplies, the photographer and brief cases as loaded in that compartment and moves the index to 34.5 as illustrated in view O.

(10) Set slide to the compartment zero line as shown in view P.

Move indicator until the hairline is over 125 on the "TAIL" compartment scale. This adds the balance moment of 125 pounds as loaded in the tail compartment and completes calculation of the balance moments of all items as initially loaded in the airplane. It has moved the airplane index to 38.0 as shown in view Q.

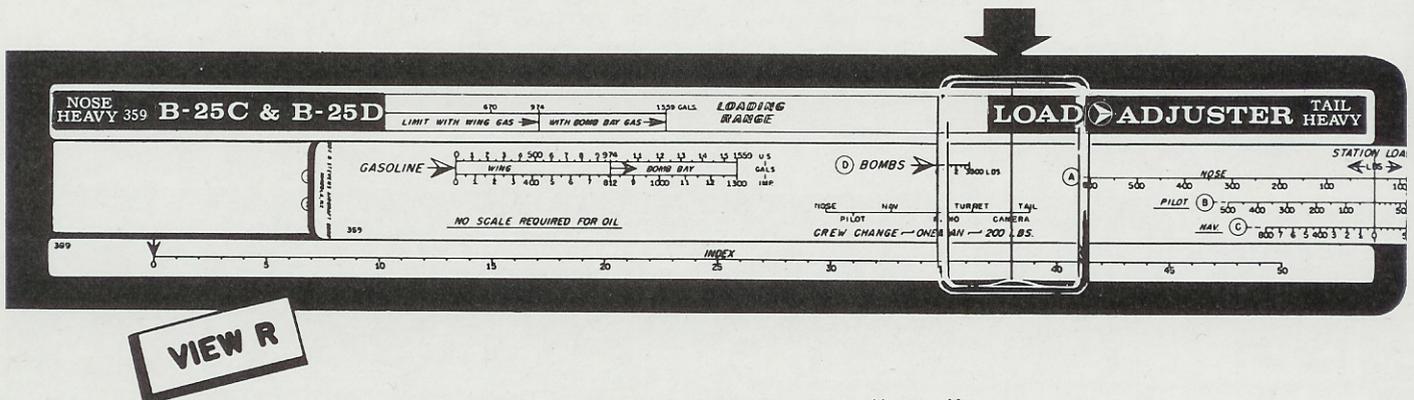

(11) Balance Correction.

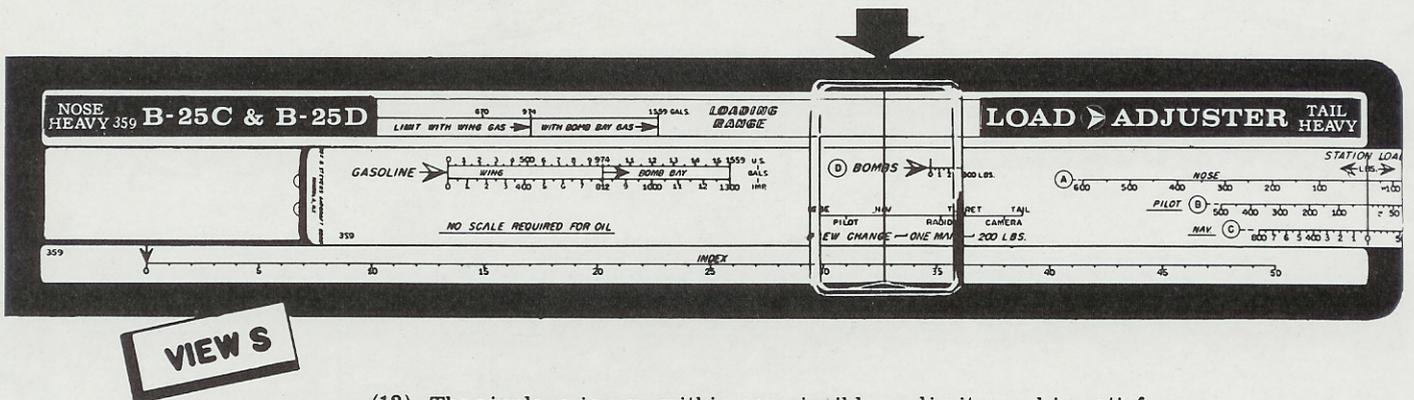

(a) Adding the weights of all items loaded (paragraph 1.c. of this section) shows the gross load of the airplane well within allowable limits, and, as far as weight alone is concerned, the airplane may be flown. However, the load adjuster indicator hairline is located in the red portion of the loading range which ABSOLUTELY PROHIBITS any attempt to fly the airplane because of a dangerous tail-heavy condition.

(b) This "out of balance" condition may be corrected by shifting some of the load or a member of the crew from an aft position to a forward position in the airplane, the amount of change required being predetermined by a "tril shift" of load on the load adjuster. In this sample case, shifting the photographer from the camera position in the rear entrance compartment forward to the navigator's compartment will bring the airplane balance well within cg limits.

(c) With the indicator hairline remaining on the last index (38.0), move the slide until "CAMERA" of the "CREW CHANGE-ONE MAN-200 LBS" scale is under the indicator hairline as shown in view R.

Move the indicator until its hairline is over "NAV." on the crew change scale. This changes the balance moment of one man (200 lb) from the camera position to the navigator's compartment, and moves the index to 32.7 as shown in view S.

(12) The airplane is now within permissible cg limits, and is satisfactory for flight. It is entirely permissible to shift miscellaneous cargo, baggage, or other items within the airplane to make the final balance fall within approved limits. The load adjusting instrument is exceedingly simple to operate, equally accurate, and the airplane should be loaded as it indicates.

CAUTION: Do NOT shift or dispose of any load without first predetermining (by use of the load adjuster) that the balance will remain within limits after the change is made.

SECTION III

FLIGHT OPERATION DATA1. Determining Gross Weight.

Secure gross weight from Form F, Weight & Balance Clearance.

2. Flight Planning.

The following outline may be used as a guide to assist personnel in the use of the FLIGHT OPERATION INSTRUCTION CHART for flight planning purposes.

a. If the flight plan calls for a continuous flight where the desired cruising power and air speed are reasonably constant after take-off and climb to 5000 feet, the fuel required and flight time may be computed as a "single section flight."

(1) Within the limits of the airplane, the fuel required and flying time for a given mission depend largely upon the speed desired. With all other factors remaining equal in an airplane, speed is obtained at a sacrifice of range, and range is obtained at a sacrifice of speed. The speed is usually determined after considering the urgency of the flight plotted against the range required. The time of take-off is adjusted so as to have the flight arrive at its destination at the predetermined time.

(2) Select the FLIGHT OPERATION INSTRUCTION CHART for the gross weight to be used at take-off. Locate the largest figure entered under "gph" (gallons per hour) in column I on the lower half of the chart. Multiply this figure by the number and/or fraction of hours desired for reserve fuel. Add the resulting figure to the number of gallons set forth in footnote No. 2, and subtract the total from the amount of fuel in the airplane prior to starting of engine. The figure obtained as a result of this computation will represent the amount of gasoline available and applicable for flight planning purposes on the RANGE IN AIR MILES section of the FLIGHT OPERATION INSTRUCTION CHART.

(3) Select a figure in the fuel column equal to, or the next entry less than, the available amount of fuel in the airplane, as determined in paragraph 2.a.(2) above. Move horizontally to the right or left and select a figure equal to, or the next entry greater than, the air miles (with no wind) to be flown. Operating values contained in the column number in which this figure appears, represent the highest cruising speed possible at the range desired; however, the airplane may be operated in accordance with values contained under OPERATING DATA in any column of a higher number, with the flight plan being completed at a sacrifice of speed but at an increase in fuel economy.

(4) Using the same column number selected by applications of instructions contained in paragraph 2.a.(3) above, determine the indicated air speed (in mph or knots, whichever is applicable to the calibration of instruments in the airplane) and gallons per hour listed at sea level in the lower section of the chart under the subtitle OPERATING DATA. Divide this IAS into the air miles to be flown and obtain the calculated flight duration in minutes, which can then be converted into hours and minutes and deducted from the desired arrival time at destination in order to obtain the take-off time (without consideration for wind). To allow for wind, use the above IAS as ground speed and calculate a new corrected ground speed with the aid of a flight calculator or by a navigator's triangle of velocities.

(5) The airplane and engine operating values listed below OPERATING DATA in any single numbered column are calculated to give constant miles per gallon at any altitude listed. Therefore, the airplane may be operated at any altitude and at the corresponding set of values given, so long as they are in the same column listing the range desired.

CAUTION: Ranges listed in column I under "Max. Cont. Power" are correct only at the altitude given in footnote 1, and the engine and airplane operating data listed under OPERATING DATA will give constant miles per gallon if operation is consistent with values set opposite the listed altitudes.

(6) The flight plan may be readily changed at any time enroute, and the chart will show the balance of range at various cruising powers by following the INSTRUCTIONS FOR USING CHART printed on each page.

(7) Multiple charts are provided to give accurate data for operation at different gross weights, different external loads, and/or different combinations of engine use, such as single engine operation. Extreme caution should be exercised to assure selection of the correct chart applicable to the specific operating condition.

b. If the original flight plan calls for a mission requiring changes in power, speed, gross load, or external load, in accordance with the titles shown at the top of each chart provided, the total flight should be broken down into a series of individual short flights, each computed as outlined in paragraph 2.b. in its entirety, and then added together to make up the total flight and its requirements.

MODEL (S)

B-25C
B-25D

FLIGHT OPERATION INSTRUCTION CHART

SHEET 1 OF 8 SHEETS

EXTERNAL LOAD ITEMS

NONE

GR. WT. **34,000** TO **30,000** POUNDS

CONDITION	R.P.M.	M.P. (IN HG.)	BLOWER POSITION	MIXTURE POSITION	DURATION IN. MIN.
TAKE-OFF	2600	44.0	LOW	FULL RICH	5
MILITARY POWER	2600	42	LOW	FULL RICH	5
ENGINE (S)	R-2600-13				

INSTRUCTIONS FOR USING CHART: Select figure in fuel column equal to or less than total amount of fuel in airplane. Move horizontally to the right or left and select a figure equal to or greater than the air miles to be flown. Vertically below and opposite desired cruising altitude read optimum cruising conditions. NOTES: (A) Avoid continuous cruising in Column I except in emer-

gency. (B) Columns (II, III, IV & V) toward the right progressively give increase in range at sacrifice in speed. (C) Manifold Pressure (M.P.), Gallons Per Hour (G.P.H.), and True Airspeed are approximate maximum values for reference. (D) For quick reference, take-off and military power data are listed in the upper left corner of chart.

EXTERNAL LOAD ITEMS
1 TORPEDO OR 8 WING BOMBS

GR. WT. 31,000 TO 26,000 POUNDS

CONDITION	R.P.M.	M.P. (IN HG.)	BLOWER POSITION	MIXTURE POSITION	DURATION IN. MIN.
TAKE-OFF	2600	44.0	LOW	FULL RICH	5
MILITARY POWER	2600	42	LOW HIGH	FULL RICH	5
ENGINE (S)	R-2600-13				

INSTRUCTIONS FOR USING CHART: Select figure in fuel column equal to or less than total amount of fuel in airplane. Move horizontally to the right or left and select a figure equal to or greater than the air miles to be flown. Vertically below and opposite desired cruising altitude read optimum cruising conditions. NOTES: (A) Avoid continuous cruising in Column I except in emer-

gency. (B) Columns (II, III, IV & V) toward the right progressively give increase in range at sacrifice in speed. (C) Manifold Pressure (M.P.), Gallons Per Hour (G.P.H.), and True Airspeed are approximate maximum values for reference. (D) For quick reference, take-off and military power data are listed in the upper left corner of chart.
